- What layer adds the most to the container image? How much does it add?

The install python3-pip add the most, it adds about 98 MB.

```
/bin/sh -c apt-get install -y python3-pip
```

- Take a screenshot of the image generated and its size for your lab notebook. How much smaller is the image than the Ubuntu one?

```
jgafron@course-vm:~/cs430-src/04_container_dockerhub$ docker images
REPOSITORY    TAG       IMAGE ID       CREATED        SIZE
helloalpine   latest    82d202993ec0   About a minute ago   57.7MB
python        alpine    d5cb4e1bd67f   2 weeks ago      44.9MB
```

It is about half, with a size of 57.7 MB

- Show the output of this command in a screenshot for your lab notebook. What might have happened?

```
jgafron@course-vm:~/cs430-src/04_container_dockerhub$ docker exec -it helloa /bin/bash
OCI runtime exec failed: exec failed: unable to start container process: exec: "/bin/bash": stat /bin/bash: no such file or directory: unknown
jgafron@course-vm:~/cs430-src/04_container_dockerhub$
```

It could be a permissions error, but the “no such file or directory” part makes me think that Bash isn't even installed.

- Take a screenshot of the output of each

```
jgafron@course-vm:~/cs430-src/04_container_dockerhub$ docker exec -it helloa /bin/sh
/app # ls /etc/alpine-release
/etc/alpine-release
/app # ps -ef
PID   USER     TIME   COMMAND
    1  root      0:00   python3 app.py
    7  root      0:00   /usr/local/bin/python3 app.py
   16  root      0:00   /bin/sh
   23  root      0:00   ps -ef
/app #
```

Take a screenshot of the container image and its size
